

SMART YACHT SOLUTIONS - USE CASE

Remote Dive Compressor Control

Operate your dive compressor from the tank-filling station with clear status feedback.

THE SOLUTION

Full control of your dive compressor - exactly where you need it.

On many sailing yachts, the dive compressor is installed in a front locker due to space constraints, while diving tanks are stored and filled at the rear of the vessel. This creates a practical challenge: starting or stopping the compressor requires moving through narrow side decks or interior passages - often multiple times during the filling process.

Key benefits

- Start and stop compressor from the dive tank location
- No need to access narrow front lockers
- Real-time feedback during tank filling
- Clear status when filling is complete

KEY POINT 1

Start and stop compressor from the dive tank location

KEY POINT 2

No need to access narrow front lockers

KEY POINT 3

Real-time feedback during tank filling

YOUR YACHT. YOUR CONFIGURATION.
